COSC3500 2D Orbital Simulation Report

Maxwell Bo (43926871)

August 17, 2018

Description

Implementation

Correctness

Performance & Scaling

The addition of the -march=native compiler flag, which enables the use of all CPU specific instructions, provided no recognizable improvement in running time.

The use of the GCC and Clang Profile-Guided Optimisation features provided no recognizable improvement in running time.

Distressingly, -00, -01, -02, -03 showed no recognizable improvement in running time. -0fast led to an -4%-ish performance regression.

ast led to all -4/0-ish performance regression.

Two performance fixes were divised.

void Body::exert_force_unidirectionally(constBodythere)doublem1 = m; doublem2 = there.m; doubler = distantial double F = (G * m1 * m2) / r2;

double $delta_x = there.x - x; double delta_y = there.y - y;$

// turn the displacement vector between our two points into a force vector // of the desired magnitude double $scale_f actor = F/r$;

 $\label{eq:final_factor} \text{Fx} \mathrel{+}= \text{delta}_x * scale_factor; \\ Fy+= delta_y * scale_factor; \\$

Here, we are recalculating

gcc -g -lstdc++ -Wall -pedantic -Wextra -std=c++11 -lm -O3 -march=native Body.o QuadTree.o main.o utils.o -o nbody Barnes-Hut enabled: false Leapfrog enabled: true Total CPU time was $13.938825\ 12000001$ simulation steps computed
